                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bolynucleotide encoding a by Talke protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of plant results in enhanced endosperm development and expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylation. The present transcription of target genes by demethylation. The present
                                                                                                               The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (EBMETER, previously known as ATROPOS (ATR)) Domain A, Bo or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint, central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgentc plant comprising a concoling a DMT-like protein and a transgentc plant comprises of polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of their protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide to S-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising a sequence or C -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEMETER, previously known as ATROPOS (ATR)) Domain A, or C or their combinations. Also included are an expression

                                                                                     polynucleotide encoding a bwr-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results to modulation of methylation of chromosomal DNA in the call, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylation, the present transcription of target genes by demethylation. The present
cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a

                                                                                                                                                                                                                                                                      5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% indentical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included as an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is
                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C

                                                                                                                                                                protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates sequence represents a DMT-like protein. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, E or C or their combinations. Also included are an expression assette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT S' flanking sequence, DMT 3' flanking sequence or an 5' untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 497 KVQLDPETSRVWKLLMSSIDCDGVDGSDEEKRKWWEEERNMFHGRANSFIARMRVVQGNR 556

SUBTRANT ON DATE: March 11, 1998

CLASSIFICATION INDER: US/09/041,236

FILING DATE: March 11, 1998

CLASSIFICATION: 514

ATTORNEY FAGENT INFORMATION:

NAME: OSMAN, RICHARD A

RECISTRATION NUMBER: SEL198-001

TELEPHONE: (650) 343-4341

TELECOMMUNICATION INFORMATION:

TELEPHONE: (650) 343-4342

INFORMATION FOR SEQ ID NO: 2:

SEQUENCE CHARACTERISTICS:

LENGTH: 634 amino acids

TYPE: amino acids

TYPE: MINDER: Linear

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 317, Application US/09620412C

Patent No. 6448234

GENERAL INFORMATION:

APPLICANT: Steven P. Fling

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT AND TITLE OF INVENTION: COMPOSITIONS OF CHLAMYDIAL INFECTION

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

CURRENT FILING DATE: 2000-07-20

NUMBER OF SEQ ID NOS: 363

SOFTWARE: FastSEQ for Windows Version 3.0/4.0

SEQ ID NO 317

LENGTH: 646
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

Patent No. 6207801

GENERAL INFORMATION:
APPLICANT: Alnemi, Emad S.
APPLICANT: Alnemi, Emad S.
TITLE OF INVENTION: FADD-LIKE ANTI-APOPTOTIC MOLECULES, METHODS OF TITLE OF INVENTION: Of MAKING THE SAME, AND COMPOSITIONS FOR AND METHODS TITLE OF INVENTION: Of MAKING THE SAME NUMBER OF SEQUENCES: 17
CORRESPONDENCE ADDRESS:
ADDRESSEE: MOOGCOCK, Washburn, Kurtz, Macklewicz & No. 6207801ris
                                                                                            APPLICANT: Alnemil, Emad S.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 6 Sequence 4 Sequence 4 Sequence 5 Sequence 5 Sequence 5 Sequence 5 Sequence 7 Sequence 7 Sequence 1 Sequence 1 Sequence 2 Sequence 2 Sequence 2 Sequence 2 Sequence 2 Sequence 2 Sequence 3 Sequence 3 Sequence 4 Sequence 4 Sequence 4 Sequence 5 Sequence 5 Sequence 6 Sequence 6 Sequence 7 Sequence 7 Sequence 7 Sequence 7 Sequence 7 Sequence 6 Sequence 6 Sequence 7

"Molecular genetic analysis of myoc, a Dictyostelium myosin I.";
J. Cell Sci. 108:1093-1103(1995).
-!- FUNCTION: MYOSIN IS A PROPEIN THAT BINDS TO ACTIN & HAS ATPASE
ACTIVITY THAT IS ACTIVATED BY ACTIN.
-!- SUBUNIT: MYOSIN I HEAVY CHAIN IS SINCLE-HEADED. DIMER OF A HEAV
AND A LIGHT CHAIN. INABILITY TO SELF-ASSEMBLE INTO FILAMENTS.
-!- SIMILARITY: CONPAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
                                                                              ;

                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATRODOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMTs, flanking sequence, DMT 3 flanking sequence or an 5 ' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably adrobacterium by sexual cross, and selecting a host cell preferably in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in an Arabidopsis leaf results in modulation of methylation of protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The protein of target genes by demethylation. The present repulses and regulates as sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;
                                                                                                                                                                                                                                                                                       New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMPTER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5. flanking sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a crossing a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into-a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the protein in a DNA in the cell, reducting a nucleic acid in a sample. DEMETER is related to 5-methylotycine glycosylases and regulates

The invention relates to an isolated polynucleotice at least 40% identical to DWT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or Complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C their compliations. Also included are an expression assette comprising the polyvuclectide or comprising a heterologus polynuclectide under the control of a promoter at least 70% identical to DWT 5' flanking sequence or an 5' untranslated ercoding a DWT-like protein. The expression cassette is polynuclectide encoding a DWT-like protein. The expression cassette is polynuclectide encoding a DWT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is cappalle of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a plant cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the DEMETER is related to 5-methylcytosine glycosylases and regulates

The polynucleotide is useful for detecting a nucleic acid in a sample. The DEMETER is related to 5-methylcytosine glycosylases and regulates
                                                                                                                                                                                                                                                                                                                                                           New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide sequence or their

                                                                                                                                                                                                                                                                                                                        complement endoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or or their compliantions. Also included are an expression carsette comprising the polynucleotide or comprising a heterologues polynucleotide or comprising a heterologues polynucleotide comprising a heterologues polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exagence or an 5' untranslated region of DMT, a host cell comprising an exagence or an 5' untranslated comprised bMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following blological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a harbidopsis leaf results in expression of the protein in a harbidopsis leaf results in expression of the protein in a harbidopsis leaf results in expression of the protein in a sample. DEMETER is related to 5-methyloytosine glycosylasses and requiates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3;
                                                                                                     B
                                                                                                                                                                                                                                          cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein into a cell results in modulation of free protein of cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present
                                                                                 complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or Cor their combinations. Also included are an expression cassette comprising the polymucleotide or comprising a heterologous polymucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polymucleotide encoding a DMT-like protein and a transgenic plant comprising a polymucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual
New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                       The invention relates to an isolated polynucleotide sequence or their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            104 KXXXXLRTEHXVXXLPDXHXXLXXXDX-----XXYLLXIWXPXXXXXX----XXXXXX 152

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% and complement encoding a polypeptide having a sequence at least 40% or their combinations. Also included are an expression or their combinations. Also included are an expression or cassette comprising the polynucleotide or comprising a heterologous cassette comprising the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide condition and a transgenic plant comprising a cooling a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a prabidospisal leaf results in expression of the protein in a prabidospisal leaf results in expression of the method or method or the protein in a protein in an Arabidospisal leaf results in expression of the method or method or the protein in a protein in an Arabidospisal leaf results in expression of the method or method or the protein in an Arabidospisal leaf results in expression of the method or metho
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          32 KNVSRLRTEHYVYELPDKHPLLKQMEKREPDDPSPYLLAIWTP-GETANSIQPPEQSC-- 88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          10;

                                                                                                                                                                                                                                                                                                                                                                                                                    δ
                                                                                                                                                                                                                          3;
                                                              The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant

cross, and selecting a host cell with modulated transcription. Where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylatycosine glycosylases and regulates transcription of target genes by demethylation. The present
                         or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual
identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          64 PCRTAMRGSFPLNGTYFQVNEVFADHCSSQNPIDVPRSWIWDLPRRTVYFGTSVPTIFRG 123

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4
protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates sequence represents a DMT-like protein. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, or C or their combinations. Also included are an expression

cassette comprising the polynucleotide or comprising a heterologous bolynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the chromosomal DNA in the cell, reduction of expression of the protein in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    104 KXXXXLRTEHXVXXLPDXHXXLXX-----XDXXXYLLXIWXPXXXXXX----XXXXXXX 153

The invention relates to an isolated polynuclectide sequence or their complement encoding a polypeptide having a sequence at least 40% complement encoding a polypeptide having a sequence at least 40% complement encoding a polynucled, who was a RTRODGS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynuclectide or comprising a heterologous composition of DMT, a host cell comprising an exogenous polynuclectide to DMT, a host cell comprising an exogenous polynuclectide casoling a DMT-like protein and a transgenic plant comprising a composition a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing cost, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following cross, and selecting a host cell with modulated transcription of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant cell, reduction of expression of the protein in a plant cell, reduction of expression of the protein in an Arabidopsis leaf results in modulation of methylation of plant in a plant results in modulation of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynuclectide is useful for detecting a nucleic acid in a sample. ComeMETER is related to 5-methylcytosine glycosylases and regulates composition of purpose by demethylation. The present regulates a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMPTER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' lanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the

                                              The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% dentical to DMT (DEMPTER, previously known as ATROPOS (ATR)) Domain A, B control to their combinations. Also included are an expression assette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5. flanking sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual the protein is capable of exhibiting at least one of the following bloological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of plant results in a delay in flowering time, introduction of plant results in enhanced endosperm development and expression of the protein in a Arabidopsis leaf results in expression of the protein in a plant result for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The company capages and regulates are appreased to seminate a part of the protein of terraget genes by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3;
                                                                                                                                                                                                                                                                                       New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1745 KNVSRLRTEHQVYELPDSHPLLEGFNQREPDDPCPYLLSIWTP-GETAQSTDAPKSVC-- 1801

```
The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a condulating a pMT-like protein. The expression cassette is confound a DMT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following brotein in a plant results in addition of methylation of the protein in a plant results in a modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the model of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ë.

complement encoding a polypeptide having a sequence at least 40% of complement encoding a polypeptide having a sequence at least 40% of complement encoding a polypeptide having a sequence at least 40% of core for their complements. Also included are an expression cassette comprising the polynucledide or comprising a heterologous cassette comprising the control of a promoter at least 70% identical to polynucleotide under the control of a promoter at least 70% identical to comprise in sequence. Dary a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a compliant and a transgenic plant comprision cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following to protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein into a new plant results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDRA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The DEMETER is related to 5-methylcytosine glycosylases and regulates construction of transcription of tearget genes by demethylation. The present
                                                                                                                                                                                                                                                                New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1214 KNISQLRTEHRVYELPDEHPLLAQLEKREPDDPCSYLLAIWTP-GETADSIQPSVSTC-- 1270

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                               The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a condulating a DMT-like protein and a transgenic plant comprising a condulating a polynucleotide encoding a DMT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium of the following bloogical activities, which include enhanced expression of the protein in a plant results in a doublation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Content of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Content of the protein in an Arabidopsis by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3;
